2018 CMC-South Annual Conference

# Deficiency Time Rigor

David Mattoon  
Meaning for Memory

# Deficiency: Students or Environment?

In educational settings, this construction of dis/ability manifests in the double education system that splits general education and special education. Scholars have traced the ways in which special education “serves as a vehicle for preserving general education in the midst of ever increasing diversity” (Reid & Valle, 2004, p. 468, paraphrasing Dudley-Marling, 2001; also see Skrtic, 1991, 2005). **Rather than using research-validated frameworks like Universal Design for Learning (UDL) and Complex Instruction (CI) to deliver rigorous, high-cognitive demand instruction to all mathematics students, the system of special education shunts certain students (especially students of color) into an inferior, segregated mathematics education, thus providing a band-aid to a broken general education system and preventing larger, more systematic changes.**

Returning to the assumptions inherent in the concept of intervention, a disability studies perspective problematizes **the taken-for-granted assumption that what is “wrong” with the situation requiring intervention is a pathology or deficit within students. Instead, the problem is located in the inaccessibility of the environment; in other words, what needs to be changed is not the student, but rather the environment to allow access for students who differ from one another.** As Reid and Valle (2004) assert, “the responsibility for ‘fitting in’ has more to do with changing public attitudes and the development of welcoming classroom communities and with compensatory and differentiated instructional approaches than with individual learners (Shapiro, 1999). In other words, **our focus is on redesigning the context, not on ‘curing’ or ‘remediating’ individuals’ impairments**” (p. 468). A related line of research of working group members involves conceptualizing interventions into participation rather than content. That is, **what interventions might contribute to more equitable participation and deeper engagement across students in mathematics classrooms**? For example, one of the working group members has conducted empirical research focused on equitable participation in a Cognitively Guided Instruction algebra routine. Moreover, a political/relational model suggests that inaccessibility is embedded in the context of power relations. **Finding ways to “intervene” to make the environment accessible, then, also requires analyzing the power relations involved** in maintaining inaccessibility.

<http://jamessheldon.com/reframing-interventions-in-mathematics-education-emerging-critical-perspectives/>

# Change the Environment

**David Mattoon**

**Meaning for Memory**

**Time:  
I don't have it.**

# I might make time to...

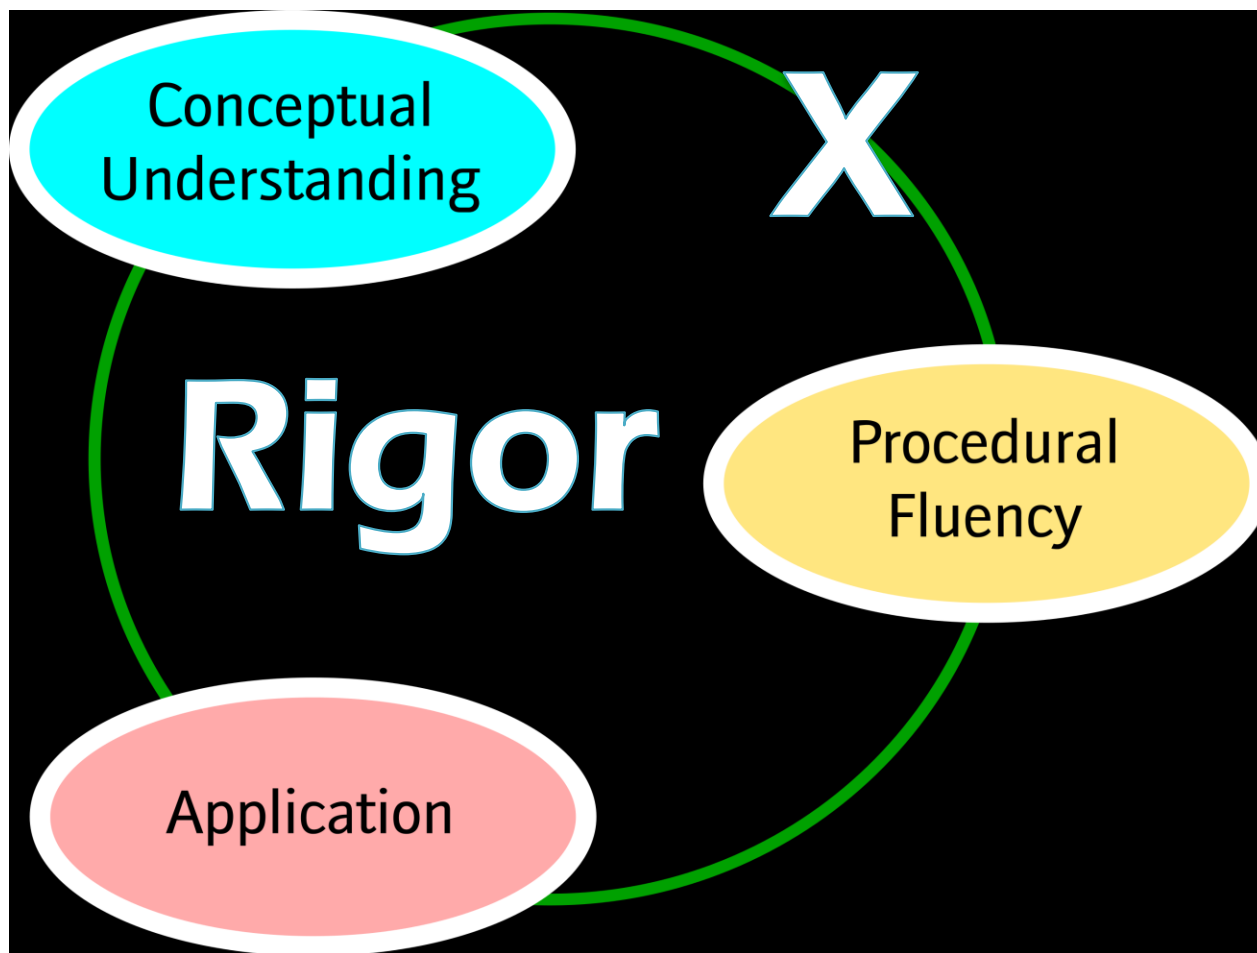

**Pictorial Math will save you time in the long run as it will aid students in understanding what to do, why they do it, and how to transfer the knowledge.**

- Review in the beginning of the year
- Introduce new material by re-teaching material from former grade levels
  - I am not talking about making connections to former material here.
- Reteach for full periods when they don't understand
- Reteach for full periods when they cannot remember
  - I am not talking about interleaving
- Teach multiple procedures for slightly different problems
  - I am not saying procedures are bad.

# Substitution: Volume with Surface Area Meaning of a Cubic Term

David Mattoon  
Meaning for Memory

# **Lesson Introduction: Draw Two Congruent Cubes**

**On the  
gridded side  
of your  
whiteboard,  
draw three  
congruent  
cubes.  
(Model how  
to draw a  
cube in two  
dimensions)**

# What was the side length of your cube?

**You had a side length of four.**

**A  $4 \times 4 \times 4$  made an volume of 64 units.**

**Another way to write that would be  $4^3$ . Two of them would be  $2 \cdot 4^3$**

**You had a side length of 10.**

**A  $10 \times 10 \times 10$  made an volume of 1000 units.**

**Another way to write that would be  $10^3$ . Two of them would be  $2 \cdot 10^3$**

**I can draw them all !**

**I will draw all  
of your cubes  
in less than 30  
seconds...**

**All the sides lengths in a single picture, MIRACULOUS algebra!**

**What is the length of the side of my cubes as labeled?**

**Any length.**

**Notice a cube has three dimensions length, width and height (or depth)**

# Anatomy of an Algebraic Term

What is the length of the side of my cubes as labeled?

**A  $x^1 \cdot x^1 \cdot x^1$  made an volume of  $x^3$ .**

**Two of them would be written as  $2x^3$ .**

**Count the unit cubes.  
How many cube units?**

**If I make  
 $x=9$ , then  
how many  
cube units  
do I have?**

**How did  
you count  
it? Tell a  
partner.**

# How did you count it? What does that have to do with Order of Operations?

How did you  
count it?

One box at a  
time?

$$1+1+1...=1458$$

Count one  
square layer  
then multiply  
by nine and  
then two?

$$81 \times 9 \times 2 = 1458$$

Multiply the  
side lengths  
and then  
multiply by  
two?

$$(9 \times 9 \times 9) \times 2 = 1458$$

How did you count it? One cube at a time?

$$9^3 + 9^3 = (9 \cdot 9 \cdot 9) + (9 \cdot 9 \cdot 9) = 729 + 729 = 1458$$

# Do you understand what you are doing in context?

$$1x^3 + 1x^3$$

$$2x^3$$

$$2(9)^3$$

$$2(729)$$

$$1458$$

If I make  $x=9$ , then how many cube units do I have?

How many in each cube, what is the volume of a single cube?  
 $(9)^3 = 729$

How many altogether?  
 $2(729) = 1458$

Notice order of operations makes sense in this volume context.

# What is the volume of your two cubes?

$x$

$2x^3$

$2(\quad)^3$

$2(\quad)$

Find the volume of your two cubes by substituting into the algebraic expression.

Write it on the other, blank side of your whiteboard.

Show your work using proper notation like that on the left.

Have someone nearby check your work.

## **Extension: Find the Surface Area**

**These are two Braille rubix cubes. I need to put colored stickers on them so people who don't know Braille can do them.**

**How many stickers do I need?**

## Extension: Find the Surface Area

$$2(3^2 + 3^2 + 3^2 + 3^2 + 3^2 + 3^2)$$

$$2[6(3^2)]$$

$$2[6(9)]$$

$$2[54]$$

$$108$$

Is this a progression of simplifying an expression or different entry points? **Notice order of operations once again makes sense, you find the surface area of one then multiply.**

Did anyone think of it like this:

$$12(9)=108?$$

# Find the Surface Area of Every Person's Two Cubes

$x$

$$2(x^2 + x^2 + x^2 + x^2 + x^2 + x^2)$$

$$2(6x^2)$$

$$12x^2$$

What is the length of the side of my cubes as labeled?

Any length.

# Find the Surface Area of Your Two Cubes

$$\begin{aligned} & 2(x^2 + x^2 + x^2 + x^2 + x^2 + x^2) \\ & 2(6x^2) \\ & 12x^2 \end{aligned}$$

Find the surface area of your three squares by substituting in your side length into one of the algebraic expressions. Show your work on your whiteboard.

**Tell your partner which expression you picked and why?**

# **Substitution: Area with Perimeter Meaning of a Quadratic Term**

David Mattoon  
Meaning for Memory

# **Lesson Introduction: Make Three Congruent Squares**

**On the  
gridded side  
of your  
whiteboard,  
draw three  
congruent  
squares.**

# What was the side length of your square?

**You had a side length of four.**

**A  $4 \times 4$  made an area of 16 units.**

**Another way to write that would be  $4^2$ . Three of them would be  $3 \cdot 4^2$**

**You had a side length of 10.**

**A  $10 \times 10$  made an area of 100 units.**

**Another way to write that would be  $10^2$ . Three of them would be  $3 \cdot 10^2$**

# **I can draw them all !**

**I will draw all  
of your  
squares in less  
than 20  
seconds...**

**All the sides lengths in a single picture, MIRACULOUS algebra!**

**What is the length of the side of my squares as labeled?  
Any length.**

# Anatomy of an Algebraic Term

What is the length of the side of my squares as labeled?

**A  $x^1 \cdot x^1$**

**made an area of  $x^2$ .**

**Three of them would be written as  $3x^2$ .**

**Count the unit squares.  
How many square units?**

**If I make  
 $x=5$ , then  
how many  
square  
units do I  
have?**

**How did  
you count  
it? Tell a  
partner.**

# How did you count it? What does that have to do with Order of Operations?

How did you  
count it?

- One box at a time?  
 $1+1+1...=75$
- Count one box then multiply by three?  
 $25 \times 3 = 75$
- Multiply the side lengths and then multiply by three?  
 $(5 \times 5) \times 3 = 75$

# Do you understand what you are doing in context?

$$1x^2 + 1x^2 + 1x^2$$

$$3x^2$$

$$3(5)^2$$

$$3(25) = 75$$

If I make  $x=5$ , then how many square units do I have?

How many in each square, what is the area of a single square?

$$(5)^2 = 25$$

How many altogether?

$$3(25) = 75$$

Notice order of operations makes sense in this area context.

# What is the area of your three squares?

$$3x^2$$

$$3( )^2$$

$$3( )$$

Find the area of your three squares by substituting into the algebraic expression.

Write it on the other, blank side of your whiteboard.

Show your work using proper notation like that on the left.

Have someone nearby check your work.

# **Substitution: Length of a Side Meaning of a Linear Term**

David Mattoon  
Meaning for Memory

# **Lesson Introduction: Make Four Congruent Lines**

**On the  
gridded side  
of your  
whiteboard,  
draw four  
congruent  
lines.**

**Leave some  
space  
around  
them**

# Lesson Introduction: Make Four Congruent Lines

Now go back and give each of your lines a height of one so we can see them better. In other words, make them into rectangles with a height of one.

# What was the side length of your square?

If you had a length of five, then another way to write that would be  $5^1$ . Four of them would be  $4 \cdot 5^1$

If you had a side length of 10, then another way to write that would be  $10^1$ . Four of them would be  $4 \cdot 10^1$

**All the sides lengths in a single picture, MIRACULOUS algebra!**

**What is the length of the side of my lines as labeled?**

**Any length.**

# Anatomy of an Algebraic Term

What is the length of the side of my lines as labeled?

**A  $1 \cdot x^1$  made an area of  $1x^1$ .**

**Four of them would be written as  $4x^1$ .**

**Count the unit squares.  
How many square units?**

**If I make  
 $x=5$ , then  
how many  
square  
units do I  
have?**

**How did  
you count  
it? Tell a  
partner.**

# How did you count it? What does that have to do with Order of Operations?

How did you  
count it?

- One box at a time?  
 $1+1+1...=30$
- Count one rectangle then multiply by four?  
 $5 \times 4 = 20$

# Do you understand what you are doing in context?

$$1x^1 + 1x^1 + 1x^1 + 1x^1$$

$$4x^1$$

$$4(5)^1$$

$$4(5)$$

$$20$$

If I make  $x=5$ , then how many square units do I have?

How many in each line, what is the area of a single rectangle?

$$1 \cdot (5)^1 = 5$$

How many altogether?

$$4(5) = 20$$

Notice order of operations makes sense in this area context.

# What is the area of your four lines/rectangles?

$$\begin{aligned} &4x^1 \\ &4( )^1 \\ &4( ) \end{aligned}$$

Find the area of your four lines by substituting into the algebraic expression.

Write it on the other, blank side of your whiteboard.

Show your work using proper notation like that on the left.

Have someone nearby check your work.

# Why do Algebra Tiles in Middle School Mathematics?

## 6.EE.A.1

Write and evaluate numerical expressions involving whole-number exponents.

## 6.G.A

Solve real-world and mathematical problems involving area, surface area, and volume.

Sixth graders are taught about linear expressions (see next); however, they are just thrown into quadratic and cubic terms with no understanding of what they are or what they mean.

This is a shame as area, surface area & volume are sixth grade standards as well.

Algebra teachers, wouldn't you love students coming in with this knowledge?

# Levels of Abstraction aka Concreteness Fading

David Mattoon  
Meaning for Memory

# Levels of Abstraction = Concreteness Fading

## Concrete, Representational, Abstract

During the first half of my teaching career, I would spend what seemed to be the first half of a math lesson teaching a new math concept by sharing definitions, formulas, steps and procedures.

To make things more challenging for my students, I would simultaneously introduce the symbolic notation used to represent those ideas. Then, I would spend the **remainder** of the lesson **attempting** to help my students make sense of these very **new** and often **abstract ideas**.

By the end of the lesson, I could help many students build an understanding, but there was always a group I felt who I would leave behind. Like many other teachers, I was just **teaching in a very similar way to that how I was taught. I knew no different.**

However, if we consider that new learning requires the linking of new information with information they already know and understand, we should be intentionally planning our lessons with this in mind. **A great place to start new learning is through the use of a meaningful context and utilizing concrete manipulatives that students can touch and feel.**

When we teach in this way, we **minimize the level of abstraction** so students can **focus their working memory on the new idea** being introduced in a **meaningful way**.

- Kyle Pierce, *Tap into Teen Minds*, <https://tapintoteenminds.com/concreteness-fading/>

# Concreteness Fading

How many donuts are in 4 boxes of 12 donuts?

## 1 Concrete

Actual  
Doughnuts

Concrete  
Manipulatives

## 2 Visual

Drawings and  
Diagrams

## 3 Abstract

3 groups of  
4 doughnuts  
is equal to  
12 doughnuts

Symbolic

$$3 \times 4 = 12$$

# Concreteness Fading

How many doughnuts are in the giant box?

**Jerome Bruner (1966) proposed three modes of representation:**  
**Enactive representation (action-based)**  
**Iconic representation (image-based)**  
**Symbolic representation (language-based)**

# *Polynomial Expressions: What do they mean?*

David Mattoon  
Meaning for Memory

# Base Ten Blocks

1

10

100 *or*  
 $10^2$

You have to define what one is. When doing decimals, the quadratic term is one.

In the case of whole numbers, one is the small square, which makes the others ten and one hundred.

Begin referring to 100 and “ten squared” or ten in two dimensions, length and width.

# What does the base have to do with it?

1

10

100 *or*  
 $10^2$

1

5

25  
*or*  $5^2$

1

3

9 *or*  
 $3^2$

Numbers in different bases; one of each tile in each base.

In base 10, one of each is the number 111.

In base 5, one of each is the number 31.

In base 3, one of each is the number 13.

How many people had something like this in their classroom growing up?

# Place Value

Millions	Thousands			Units		
millions	hundred thousands	ten thousands	thousands	hundreds	tens	ones
1	5	6	4	7	9	8
one million, five hundred sixty-four thousand, seven hundred ninety-eight						

# It should have been something like this:

**Place Value Chart in Base Ten**

1000	100	10	1	$\frac{1}{10}$	$\frac{1}{100}$	$\frac{1}{1000}$
$10^3$	$10^2$	$10^1$	$10^0$	$10^{-1}$	$10^{-2}$	$10^{-3}$
1000.	100.	10.	1.	0.1	0.01	0.001

**Top row:** multiples of tens

**Middle row:** powers of ten (just names for multiples of ten)

**Bottom row:** decimal names for multiples of ten

8

# Or This:

1329 : one thousand, three hundred and twenty-nine  
 $1329 = (1 \times 1000) + (3 \times 100) + (2 \times 10) + (9 \times 1)$

# What Varies in Each Expression?

**What  
if it  
was  
any  
base?**

# Algebra Tiles

$1x^0$

$1x^1$

$1x^2$

Our number system is based on powers of ten; therefore, it is the exponent, which drives what shape it is.

# Algebra Tiles

1

$1x$

*Constant –  
a length of  
1 and a  
height of 1*

*Linear –  
a line of  
length  $x$   
and a  
height of 1*

$1x^2$

*Quadratic –  
a square  
with a side  
length of  $x$ .*

In the case of algebra tiles, one is the small square, which is the same as base ten. You might say it is constantly one. Really it is a constant, because the value of  $x$  will not influence it.

Begin referring to  $x$  squared as a square with a side length of  $x$ . A square with two dimensions, a length of  $x$  and a width of  $x$ .

# Anatomy of an Algebraic Term

You want students to discover this and/or be able to tell you when you ask:

What does the exponent mean?

What does the base mean?

What does the coefficient mean?

# Combining Polynomials: Addition

David Mattoon  
Meaning for Memory

# **Algebra Tiles: Show Me**

**$(1x^2 + 2x + 3)$**

$$1x^2 + 2x + 3$$

**Use the blank side of your whiteboard as your work space.**

**The unused tiles are off the whiteboard.**

# Algebra Tiles: Addition

$(1x^2 + 2x + 3) + (2x^2 + 3x + 4)$

$$1x^2 + 2x + 3$$

$$2x^2 + 3x + 4$$

Use the blank side of your whiteboard as your work space.

**Add the polynomials**

The sum is on the whiteboard, and the unused tiles are off the whiteboard.

# Algebra Tiles: Addition

$(1x^2 + 2x + 3) + (2x^2 + 3x + 4)$

Each expression individually

By the way, does it matter how you draw the linear term, vertically or horizontally?

# Algebra Tiles: Addition

$(1x^2 + 2x + 3) + (2x^2 + 3x + 4)$

$$\begin{array}{r} 1(x^2) + 2(x) + 3(1) \\ + 2(x^2) + 3(x) + 4(1) \\ \hline \end{array}$$

$$3(x^2) + 5(x) + 7(1)$$

$$3x^2 + 5x + 7$$

Have them  
put the same  
shapes  
together, aka  
combine like  
terms.

Can you put  
the terms  
together?

No, they are  
not the same  
shape.

Squares,  
Lines & Dots  
or Quadratic  
Terms, Linear  
Terms &  
Constants

# Cognitive Demand & Access

*“My students aren’t ready for algebra.”*

*“They have to master basic skills first before learning algebra.”*

While it is preferred to see algebra as a generalization of any base, could we use algebra to remediate number? Instead of going specific to general could we go general to specific?

Keep students on grade level and remediate number with Tier Two interventions using more time to relate number to algebra. In class, use polynomial addition & subtraction to remediate integers or even whole numbers.

Remediate in context of grade level material.

There is no regrouping with algebra tiles as you do not know what the base is, or how many units it takes to make the units of the next power. The lack of regrouping actually makes the cognitive demand for learning algebra less than the cognitive demand for number when using algebra tiles and base ten blocks.

# Next Level of Abstraction: Drawing the Tiles Under the Expressions

1

$x$

$x^2$

-1

$-x$

$-x^2$

“Open” is positive.

“Closed” is negative.

Referring to them as white being positive and black being negative is not a good idea.

*T: What is 4-3?*

*Ss: 1*

*T: So, why does this look like 7?*

*Ss: You have to change them to negatives.*

*T: Like this?*

*Ss: No, change all of them!*

*T: Like this?*

*Ss: No, no. Change ALL of them!*

*T: Oh, you mean I have to change ALL of them? All of minuend or subtrahend?*

*Ss: All of the subtrahend.*

After integers, my students are familiar with zero pairs. Before subtracting polynomials, I give them this problem.

# Subtracting Expressions with Algebra Tiles

$$(1x^2 + 2x + 3) - (2x^2 + 3x + 4)$$

***THIS IS NOT  
CORRECT!***

Negative means opposite so which do we switch, the minuend or the subtrahend?

Which did we switch with 4-3?

Do we change one of them or all of them?

At some point, you can point out this is the equivalent to distributing a negative one.

# Subtracting Expressions with Algebra Tiles

$$(1x^2 + 2x + 3) - (2x^2 + 3x + 4)$$

$$(1x^2 + 2x + 3)$$

$$- (2x^2 + 3x + 4)$$

***THIS IS NOT  
CORRECT  
YET***

**What is the  
opposite of  
 $2x^2$ ?**

**$-2x^2$  so  
shade it in.**

# Subtracting Expressions with Algebra Tiles

$$(1x^2 + 2x + 3) - (2x^2 + 3x + 4)$$

$$(1x^2 + 2x + 3)$$

$$- (2x^2 + 3x + 4)$$

***THIS IS NOT  
CORRECT  
YET***

**What is the  
opposite of  
 $+ 3x$ ?**

**$- 3x$  so  
shade it in.**

# Subtracting Expressions with Algebra Tiles

$$(1x^2 + 2x + 3) - (2x^2 + 3x + 4)$$

$$(1x^2 + 2x + 3)$$

$$- (2x^2 + 3x + 4)$$

***THIS IS NOT  
CORRECT  
YET***

**What is the  
opposite of  
+ 4?**

**- 4 so shade  
it in.**

# Subtracting Expressions with Algebra Tiles

$$(1x^2 + 2x + 3) + (-2x^2 - 3x - 4)$$

Diagram illustrating the subtraction of expressions using algebra tiles. The top row shows a white square (representing  $1x^2$ ) and two black squares (representing  $2x^2$ ) with red diagonal lines through them, indicating they are being subtracted. The bottom row shows algebra tiles for  $(1x^2 + 2x + 3)$  and  $(-2x^2 - 3x - 4)$ . Red diagonal lines are drawn through the tiles to show the subtraction process. The result is shown as  $-1x^2 - 1x - 1$ , which is highlighted with red boxes and circles.

From our work with integers using a context of hot rocks and cold rocks, students know that subtracting is the same as adding the opposite.

You can raise the temperature of a drink by either removing an ice cube or adding a hot rock.

# Combining Expressions: Three Column Notes

$$1x^2 - 2x + 3$$

**If you do subtraction, then make them change the shapes to the opposite before combining.**

$$-2x^2 - 3x + 4$$

**↓ Opposite**

**=**

$$3x^2 + 1x - 1$$

# Next Level of Abstraction: Drawing the Tiles Around the Symbols

$$(1x^2 - 2x + 3) + (-2x^2 - 3x + 4)$$

$$-1x^2 - 5x + 7$$

$$(11x^2 + 32x + 13) + (22x^2 - 34x + 14)$$

$$33x^2 - 2x + 27$$

*This is a good time to introduce larger coefficients.*

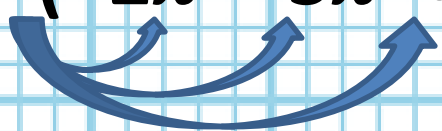

THE HORIZONTAL METHOD IS GOOD FOR DRAWING SHAPES AROUND OR BELOW.

Make your squares, quadratic, large and your rectangles, linear, smaller, but with the same side length.

Constants get circles instead of the little squares that are more difficult to draw and easily confused with quadratics.

# Final Level of Abstraction: Line Up Terms Vertically

$$\begin{array}{r} (1x^2 - 2x + 3) - (-2x^2 - 3x + 4) \\ +2x^2 + 3x - 4 \\ \hline 3x^2 + 1x - 1 \end{array}$$

*Keep asking, "Can I simplify?"*

THE VERTICAL METHOD IS GOOD FOR KEEPING LIKE TERMS

TOGETHER AND REWRITING SUBTRACTION.

You can reference the shapes as you do it . You want students to follow the procedure of combining like terms based on what they learned about the areas they represent.

You can redraw them at the end to reinforce it.

# Final Level of Abstraction: Line Up Terms Vertically

$$\begin{array}{r} (1x^2 - 2x + 3) - (-2x^2 - 3x + 4) \\ +2x^2 + 3x - 4 \\ \hline 3x^2 + 1x - 1 \end{array}$$

*No, quadratic, linear & constant*

THE VERTICAL METHOD IS GOOD FOR KEEPING LIKE TERMS

TOGETHER AND REWRITING SUBTRACTION.

You can reference the shapes as you do it . You want students to follow the procedure of combining like terms based on what they learned about the areas they represent.

You can redraw them at the end to reinforce it.

# The Distributive Property

David Mattoon  
Meaning for Memory

# Distributive Property: Reading & Drawing the Tiles

2  $(-3x + 4)$  Read, “Two groups of negative three x plus four or two groups of negative three times a number plus four.” Drawn as:

One group

Two groups

How many  
negative x's?

How many  
constants?

So, the  
product is?

$6x + 4$

Most students haven't had the conceptual instruction for multiplication.

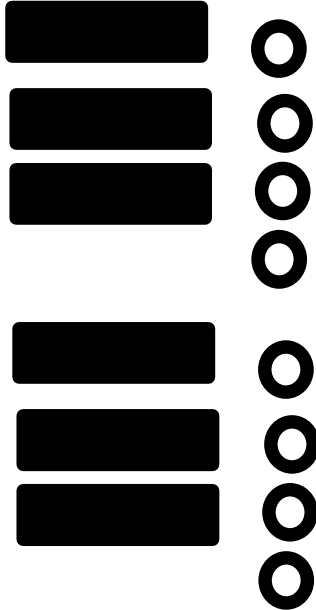

Most can multiply, but some do not realize it is making groups.

Others can tell you it is making groups, but it still does not inform their mathematics.

For example, they don't make groups to simplify. This needs to be reinforced when distributing.

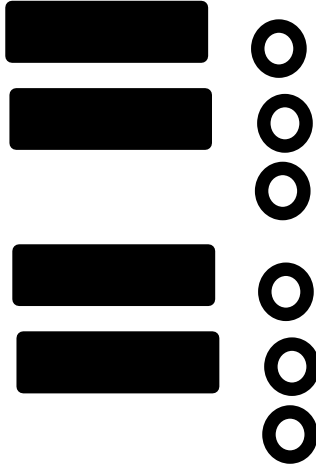

# Distributive Property: Four Column Notes

<u>Symbolic</u>	<u>Meaning in Words</u>	<u>Pictorial</u>	<u>Simplified</u>
$2(-3x + 4)$	Two groups of negative three times a number plus four		$-6x + 8$
	Three groups of two times a number minus five		

# Distributive Property: Four Column Notes

<u>Symbolic</u>	<u>Meaning in Words</u>	<u>Pictorial</u>	<u>Simplified</u>
			
$-2(4x - 3)$		 <b>Opposite</b>	

# Substitution & Context for Linear Expressions

David Mattoon  
Meaning for Memory

# Context as Support

I went through the drive-thru, and I received two hamburgers and \$4 change. Write an algebraic expression for what happened using the variable  $h$ .

What does  $h$  mean in this context?

# Context as Support

$$2h + 4$$

What does  $h$  mean in this context?

If two is the number of hamburgers, then  $h$  must be some other number.  $h$  means more than **hamburger**. It could be the weight of the meat or the price of the burger, but it has to be some number.

In this context, four being an amount of money, it is the price of the burger.

# Substitution into a Linear Expression

$$2h + 4$$

**I paid the drive-thru employee with a single bill. What was the single bill I paid with if hamburgers cost three dollars or  $h = \$3$  ?**

# Substitution into a Linear Expression

$$2h + 4$$

A paid the drive-thru employee with a single bill. What was the single bill I paid with if hamburgers cost three dollars or  $h = \$3$  ?

$$2(3) + 4$$

$$6 + 4$$

$$10$$

It was a ten dollar bill.

How does Order of Operations make sense in this context?

# Linear Substitution: Give **Peas** a Chance!

# Another Context for Linear Substitution

- How are the peas arranged in a pod?
- You can think of a pea pod as a linear term.
- Let  represent the peapod.
- Let  $\bigcirc$  represent the peas

If  $p = \#$  of peas in a pod, then...

# Another Context for Linear Substitution

If  $p = \#$  of peas in a pod, then..

How many total peas if the pea pods hold **two** peas each?

Give **PEAS** a chance

# Another Context for Linear Substitution

Give **PEAS** a chance

If  $p$  = # of peas in a pod,  
then..

How many total peas if  
the pea pods hold **two**  
peas each?

**How did you do it?**

$$3p + 4$$

$$3(\mathbf{2}) + 4$$

$$\mathbf{6} + 4$$

$$10$$

**How does Order of  
Operations make sense  
in this context?**

# Another Context for Substitution

On your whiteboard,  
draw the  
expression  
using

 to represent  
the peapod.

 to represent the  
peas

Show the substitution  
of the **three peas** in  
your picture.

If  $p = \#$  of peas in a pod,  
then..

How many total peas if  
the pea pods hold three  
peas each?

$$2(3p + 4)$$

GIVE PEAS a chance

# Another Context for Substitution

If  $p$  = # of peas in a pod,  
then..

How many total peas if  
the pea pods hold **three**  
peas each?

$$2(3p + 4)$$

$$6p + 8$$

$$6(\mathbf{3}) + 8$$

$$\mathbf{18} + 8$$

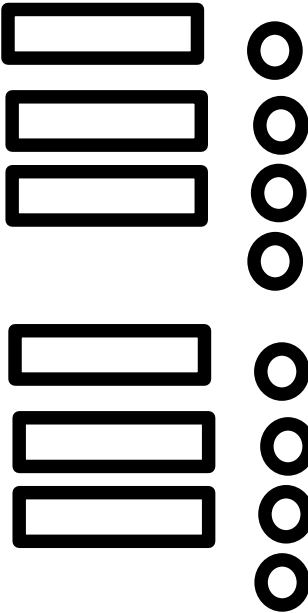

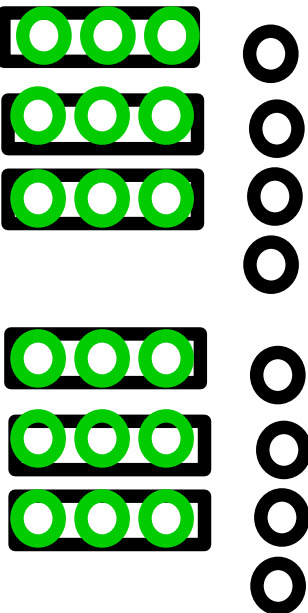

$$26$$

GIVE **PEAS** a chance

# Context for Negative Values (not the best, but it works)

Wouldn't it be weird to open a peapod and find a note saying you owe peas?

If  $p$  = # of peas in a pod, then..

Would you owe or have peas if the pea pods hold **negative two** peas each? How many?

$$3p + 4$$

$$3(-2) + 4$$

$$-6 + 4$$

-2, You would owe two peas.

# *Linear Equations in One Variable*

David Mattoon  
Meaning for Memory

# Equations: Misconceptions

- I have to “scaffold” equations
  1. One step (6<sup>th</sup> Grade)
  2. Two step (7<sup>th</sup> Grade)
  3. Distributive
  4. Variables on both sides
  5. Multistep Equations
- Ninth grade algebra starting with 6<sup>th</sup> grade, one step equations, then 7<sup>th</sup> grade, etc.
- Worse when compounded by extended beginning of the year review
- Why am I out of time?
- “Those students” get less access to grade level material and the achievement gap widens, because of who?
- Even if students taught procedurally remember for a procedural unit test, what happens when the prompts are not as procedural or the following year when students have forgotten?

**If you just finished multistep expressions, then why not start there with equations to reinforce what you have just done? It allows you to get those kids who were almost there all the way there too.**

# Scaffolding Defined

Instructional scaffolding is the **support** given during the learning process... to promote a **deeper level** of learning... These supports may include the following:

**resources** [using pictorial math provides a resource to employ]

**a compelling task** [not a simplified task]

**templates and guides** [column notes for multiple representations]

**guidance on the development of cognitive skills**

[How are students **thinking** about what they are doing?]

These supports are **gradually removed** as students develop autonomous learning strategies, thus **promoting their own** cognitive, affective and psychomotor learning skills and **knowledge**. Teachers help the students master a task or a concept by **providing support** [not simplifying content]. The support can take many forms such as outlines, recommended documents, storyboards, or key questions.

[https://en.wikipedia.org/wiki/Instructional\\_scaffolding](https://en.wikipedia.org/wiki/Instructional_scaffolding)

**I went through the drive-thru and gave them \$10.**

**I got back two hamburgers and \$4.**

**How much did the burgers cost?**

# Context as a Scaffold - Equations

**I went through the drive-thru and gave them \$10. I got back two hamburgers and \$4. How much did the burgers cost?**

**Students can do this problem without instruction in how to solve an equation, because the context is the scaffold. This refutes the argument that students must start with one step equations before solving two step equations.**

**Start with the conceptual, see how students do it, and then formalize a procedure based on what they did.**

# Context as a Scaffold - Equations

**I went through the drive-thru and gave them \$10. I got back two hamburgers and \$4. How much did the burgers cost?**

**What did you do to solve this?**

**If  $h$  = the cost of the burgers, then:**

$$2h + 4 = 10$$

$$-4 = -4$$

**Why did you do this (consider the context)?**

$$2h = 6$$

$$\frac{2}{2}h = \frac{6}{2}$$

**Why did you do this (consider the context)?**

# Context as a Scaffold - Equations

I went through the drive-thru and gave them \$10. I got back two hamburgers and \$4. How much did the burgers cost?

**What did you do to solve this?**

If  $h$  = the cost of the burgers, then:

$$2h + 4 = 10$$

$$-4 = -4$$

**Why did you do this (consider the context)?**

$$2h = 6$$

$$\frac{2}{2}h = \frac{6}{2}$$

**Why did you do this (consider the context)?**

$$h = 3$$

# Linear Equations: How Many **Peas** in the Pod?

# Context for Equations

If  $p$  = # of peas in a pod,  
then..

How many peas in the  
each pea pod? (Disregard  
the weight of the pod.)

How did you do it?

$$3p + 4 = 10$$

# Context for Equations

If  $p$  = # of peas in a pod,  
then..

How many peas in the  
each pea pod? (Disregard  
the weight of the pod.)

How did you do it?

$$3p + 4 = 10$$

$$3p + 4 - 4 = 10 - 4$$

# Context for Equations

If  $p$  = # of peas in a pod,  
then..

How many peas in the  
each pea pod? (Disregard  
the weight of the pod.)

How did you do it?

$$3p + 4 = 10$$

$$3p + 4 - 4 = 10 - 4$$

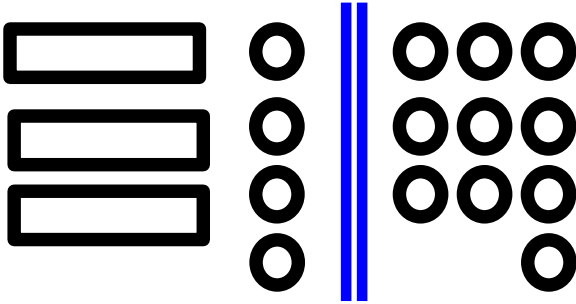

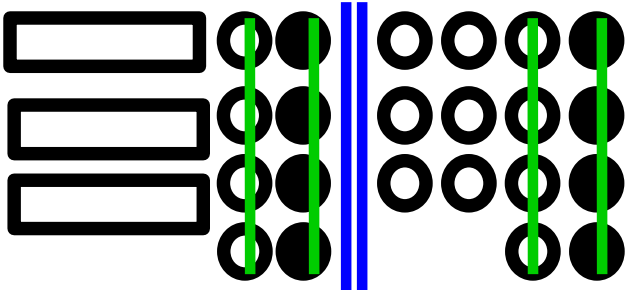

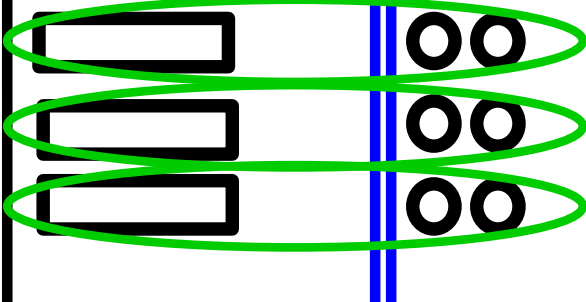

$$3p = 6$$

$$\frac{3}{3} p = \frac{6}{3}$$

$$p = 2$$

# Linear Equations: Four Column Notes

<u>Symbolic</u>	<u>Pictorial</u>	<u>What You Did</u>	<u>Property</u>
$3p + 4 = 10$		<b>Given</b>	<b>Given</b>
$3p + 4 = 10$ $-4 = -4$		Subtracting four from both sides is the same as adding a negative four to both sides.	Addition Property of Equality
$3p = 6$ $3/3p = 6/3$ $p = 2$		I divided both sides by three.	Division Property of Equality

# Linear Equations: Four Column Worksheet

Property

# Linear **Inequalities**: Four Column Worksheet

Symbolic

Pictorial

What You Did

Property

*I don't have the space here to show all four columns so I will do the symbolic and pictorial only.*

*Notice the shift to inequalities. The same method can be used to solve equations and inequalities after doing work with context to understand the differences between them.*

# Inequalities: Given - Draw the Shapes, Draw the Goal

Symbolic

Pictorial

*Try one with the algebra tiles  
with me, draw the two  
equivalent lines on your  
whiteboards with the  
inequality sign.*

$$2(-3x + 4) + 2x < -2x + 2$$

*Students usually do not know where to begin so I have them  
draw the shapes and draw the goal as the first step.*

# Inequalities: Given – Distributive Property

Symbolic

Pictorial

*Reading the shapes horizontally is what is given.*

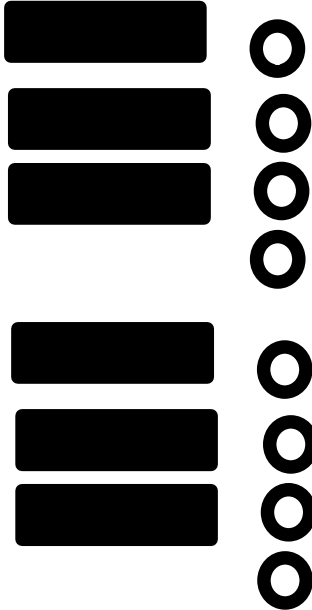

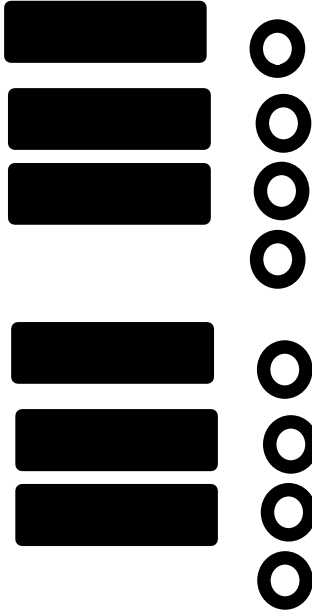

*Reading the shapes vertically is the same as distributing.*

# Inequalities: Given – Distributive Property

Symbolic

Pictorial

$2(-3x + 4) + 2x$	$<$	$-2x + 2$	
$-6x + 8 + 2x$	$<$	$-2x + 2$	

*Emphasize that you have to distribute to even draw the shapes.*

# Inequalities: Combine Like Terms & Additive Inverse

Symbolic

Pictorial

$2(-3x + 4) + 2x$	$<$	$-2x + 2$		
$-6x + 8 + 2x$	$<$	$-2x + 2$		
$-4x + 8$	$<$	$-2x + 2$		
				

*Simplify each side.*

# Inequalities: Addition Property of Equality

## Symbolic

## Pictorial

*What makes a zero pair?*

*Variables on one side & constants on the other.*

*You can do this in two steps. Once they understand the goal though, they will be comfortable with the “double switch.”*

# Inequalities: Multiplication Property of Equality

## Symbolic

## Pictorial

$$\begin{array}{rcl}
 2(-3x + 4) + 2x & < & -2x + 2 \\
 -6x + 8 + 2x & < & -2x + 2 \\
 -4x + 8 & < & -2x + 2 \\
 +2x - 8 & & +2x - 8 \\
 -2x(-1) & < & -6(-1) \\
 \text{op} & & \text{op} \quad \text{op}
 \end{array}$$

Diagram illustrating the symbolic steps of multiplying both sides of an inequality by -1. The original inequality is  $2(-3x + 4) + 2x < -2x + 2$ . The steps show the distribution of 2, combining like terms, and finally multiplying both sides by -1 to get  $-2x(-1) < -6(-1)$ . The operations are labeled 'op' (operation) and the final result is shown with a box and a circle.

*My goal is one positive unknown, x. I need the opposite of what I have so multiply both sides by -1. I have students write op-op-op, especially for knowing when to switch the signs in inequalities. Write it three times; do it three times. Notice this gets rid of any double negative division.*

# Inequalities: Division Property of Equality & Solution

Symbolic

$$\begin{array}{rcl}
 2(-3x + 4) + 2x & < & -2x + 2 \\
 -6x + 8 + 2x & < & -2x + 2 \\
 -4x + 8 & < & -2x + 2 \\
 +2x - 8 & & +2x - 8 \\
 -2x(-1) & < & -6(-1) \\
 2x & > & +6 \\
 \hline
 2 & & 2 \\
 x & > & 3
 \end{array}$$

Pictorial

*Make the coefficient one. If 2x contain 6, then how many in one?*

*Did I subtract? What operation did I use?*

*Divide by the coefficient to make a single x.*

# Next Level of Abstraction

## Drawing Around the Symbols

$$\begin{array}{lcl}
 5 + 2(-3x + 4) + 2x & \geq & -2x + 1 \\
 \textcircled{+5} \boxed{-6x} \textcircled{+8} \boxed{+2x} & \geq & \boxed{-2x} \textcircled{+1} \\
 \boxed{-4x} \textcircled{+13} & \geq & \boxed{-2x} \textcircled{+1} \\
 \boxed{+2x} -13 & & +2x \textcircled{-13} \\
 \textcircled{-2x}(-1) & \geq & \textcircled{-12}(-1) \\
 \text{op} & & \text{op} \\
 \frac{2x}{2} & \leq & \frac{+12}{2} \\
 \boxed{x} & \leq & \textcircled{6}
 \end{array}$$

*Same team or do they fight?*

*This is a good time to introduce larger coefficients or even rational coefficients.*

Where do I begin?

You cannot draw shapes around parenthesis so distribute first to get rid of them. Now draw your shapes & your goal.

Put variables on the left and circles on the right.

Opposite Side, Opposite Sign.

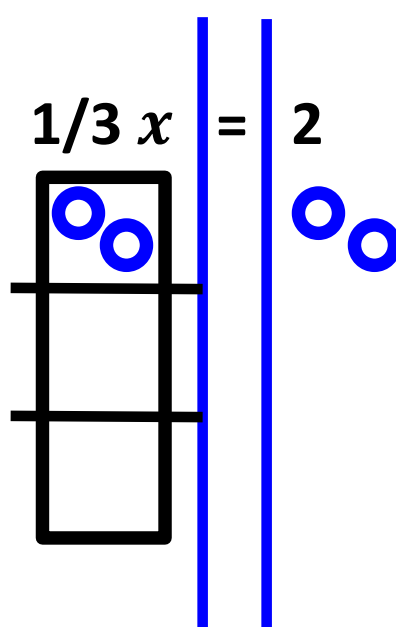

WAIT! Op-Op-Op (Multiply by Negative One)

Divide by the coefficient.

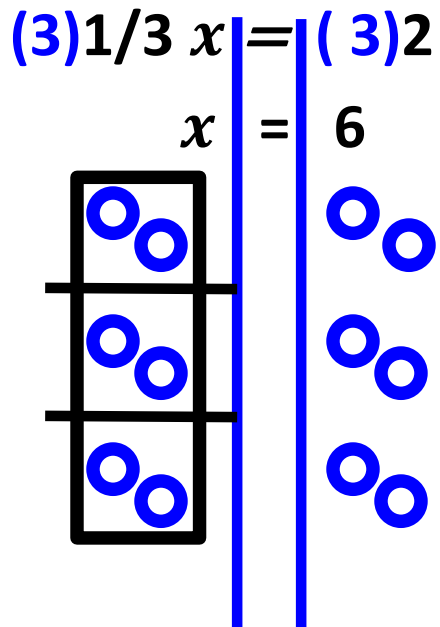

# Equations: What About Unit Fractions?

$$\frac{1}{3}x = 2$$

SO...

$$(3)\frac{1}{3}x = (3)2$$
$$x = 6$$

You can push for understanding by illustrating simple fractions with students.

What did I have to do to change the coefficient of one third to one?

I multiplied by 3 on both sides (Multiplication Property of Equality). What about one fourth? One fifth? Etc.

*This can be extended to multiplying to get rid of fractions first.*

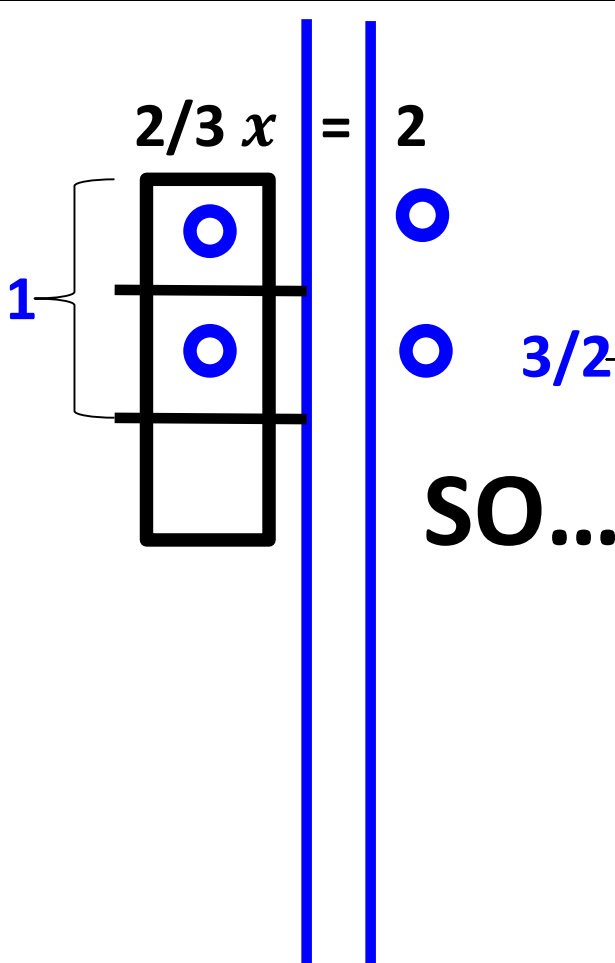

# Equations: What About Fractions?

You can push for understanding by illustrating simple fractions with students.

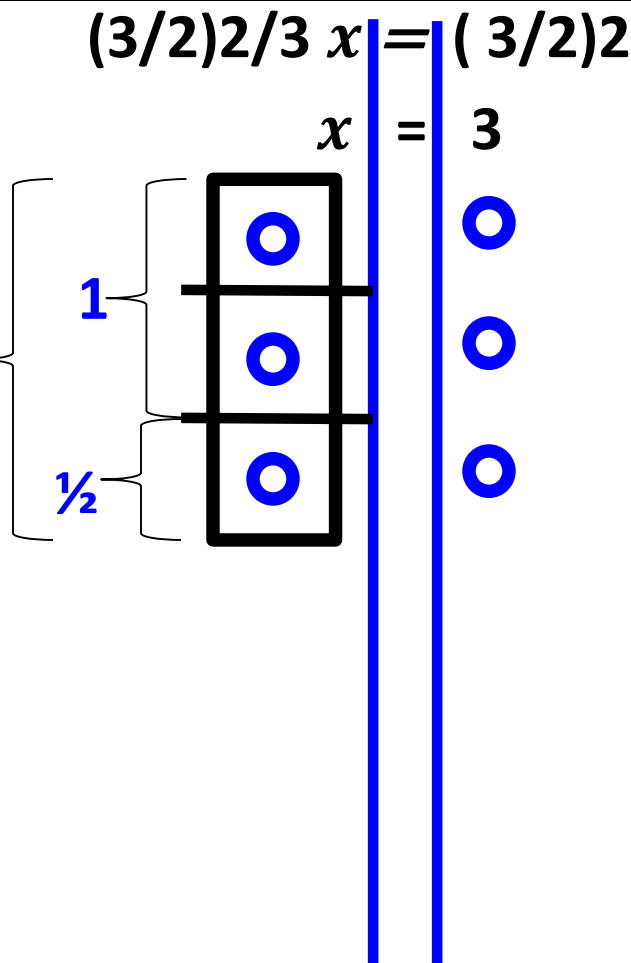

What did I have to do to change the coefficient of two thirds to one?

I multiplied by 1 ½ or 3/2 on both sides  
(Multiplication Property of Equality).

Does the reciprocal always work? What about improper fractions?

$$\frac{2}{3}x = 2$$

SO...

$$\left(\frac{3}{2}\right)\frac{2}{3}x = \left(\frac{3}{2}\right)2$$

# Equations: What About Improper Fractions?

$$\frac{5}{4}x = 5$$

Diagram illustrating the equation  $\frac{5}{4}x = 5$ . A vertical line is drawn at  $x = 5$ . To the left of the line, there are five blue circles, each inside a square box. A bracket on the left side of these boxes is labeled '1', indicating that each box represents  $\frac{1}{4}$  of the distance from the line to the origin. The top four boxes are filled with blue circles, and the bottom box is empty. The equation  $\frac{5}{4}x = 5$  is written above the line.

SO...

$$\left(\frac{4}{5}\right)\frac{5}{4}x = \left(\frac{4}{5}\right)5$$

Diagram illustrating the equation  $\left(\frac{4}{5}\right)\frac{5}{4}x = \left(\frac{4}{5}\right)5$ . A vertical line is drawn at  $x = 4$ . To the left of the line, there are four blue circles, each inside a square box. A bracket on the left side of these boxes is labeled  $\frac{4}{5}$ , indicating that each box represents  $\frac{4}{5}$  of the distance from the line to the origin. The top four boxes are filled with blue circles, and the bottom box is empty. The equation  $\left(\frac{4}{5}\right)\frac{5}{4}x = \left(\frac{4}{5}\right)5$  is written above the line.

What did I have to do to change the coefficient of five fourths to one?

I multiplied by  $\frac{4}{5}$  on both sides  
(Multiplication Property of Equality).

Would this be a good way to build some understanding of fractions without interrupting your teaching?

# Equations: Student Work

What does this student understand about equality?

Division? Integers? Fractions?

8.  $-7 = \frac{z}{2} + 1$

$z = -16$

$\frac{-16}{2} = -8$

$-8 + 1 = -7$

# Equations: Student Work

## Was she always doing that?

## What about necessary procedures?

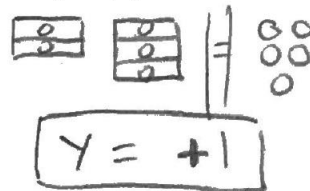

She knows and uses procedures too.

We don't know about fractions... not ready for the next level of abstraction?

Does she find this easier/faster?

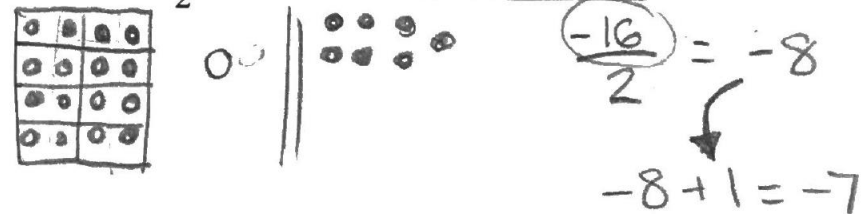

Solve the equation. Check your solution.

7.  $2y - 3y = 5$

$y = +1$

8.  $-7 = \frac{z}{2} + 1$

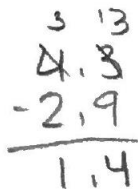

$z = -16$

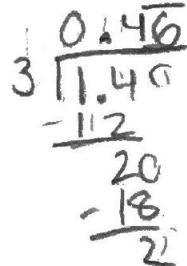

$\frac{-16}{2} = -8$

$-8 + 1 = -7$

9.  $-2.9 = 3f + 4.3$

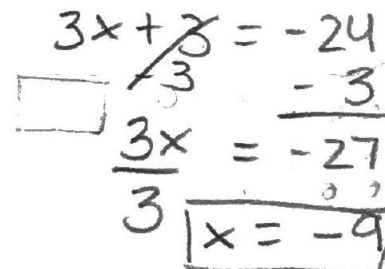

$1.4$

$f = .46$

10.  $3(x + 1) = -24$

$3x + 3 = -24$

$3x = -27$

$x = -9$

# Equations: Student Work

## It is not all roses...

7.  $2y - 3y = 5$

What is the mistake?

The student disregarded the – sign and/or failed to combine like terms.

What reengagement lesson would you design around this problem?

How could you use this student's method of substitution or guess and check correctly? (Hint: Negative means opposite.)

# Giving Students the Procedures?

Students should generalize to procedures themselves so they are more likely to remember them.

If you must provide them, then they should be a temporary resource for students. Keep them simple, short and always true:

1. Draw the shapes and the goal [this will help them begin]
2. If there are parenthesis, then you don't have a single group so you cannot draw the shapes. You must **distribute first, if necessary**.  $3(2x + 1)$  is not equivalent to  $32x + 1$ , **NOT**  $3(2x + 1)$   
While this next one is technically correct, it loses the meaning of the three groups, **NOT**  $3(2x + 1)$
3. Simplify each equivalent expression, if possible.
4. Collect variables on one side & constants on the other.
5. Make the coefficient of the variable one.

# What Materials Did I Use?

Two colors of cardstock

Slider bags

Folded blank paper

**Cheapest manipulatives EVER!**

**And they do much more than this...**

# What about the Base Ten Blocks?

Some might argue against having the same manipulative as base ten and algebra tiles.

My counter argument is why keep two manipulatives when one will do?

More importantly, I *want* them to make connections between base ten and algebraic representations of any base to aid in understanding and retention.

# Color and Algebra Tiles?

Store bought algebra tiles have “unknown” side lengths as they are trying to reinforce the that quality of the variable.

If you measure these tiles with the one, then you find they are usually between three and four. Does that mean it has a fractional side length?

All models have inherent flaws; choose the flaws that reinforce the learning when you can.

**I don't prefer the multiple color tiles. I prefer to use color to distinguish between positive and negative or different variables.**

# What about Y? Color & Algeblocks

*AlgeBlocks allow for work in three dimensions, cubic expressions & equations, and work with two variables, x & y.*

<http://www.hand2mind.com/item/algeblocks-manipulative-starter-set/9241> Expensive @ \$200 though.

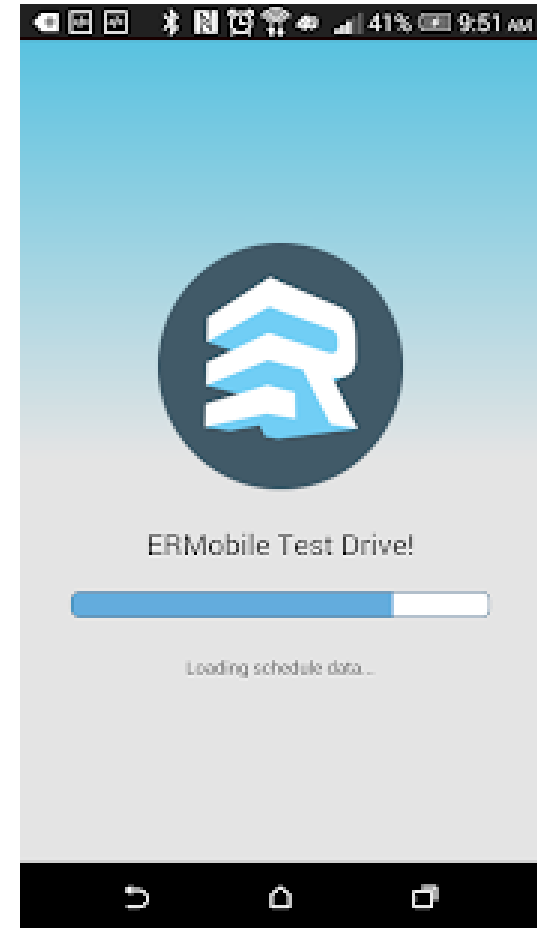

# Presentation, Questions & Feedback

Please complete the session survey via the ERMobility Conference App.
